02 - STAKEHOLDER MAPPING

KIABI 360° Framework

User Research Workstream

Prepared by: User Research and Interview Methodology Specialist

Status: Research planning document - no interviews, participant access, or KIABI staff availability are confirmed by this map.

1. Purpose of Stakeholder Mapping

Stakeholder mapping identifies whose direct experiences are needed, who influences the shopping journey, and who can explain operational constraints. It also exposes access gaps before recruitment.

Start with real people and situations, not assumptions about the proposed product. Customers describe their own decisions; employees add operational context but cannot speak for customer motivations.

Priorities indicate research order, not organisational importance: Essential means direct experience central to the problem; Important means valuable supporting context; Interesting means optional context for the initial round.

No standalone EPITECH exploratory-interview presentation was available in the repository. This map uses the assignment's priority definitions and project evidence-led approach; confirm any additional course-specific technique with the supervisor.

2. Project Context

2.1 Documented project context

The KIABI 360° Framework explores a digital fit-confidence service, framed in the project as Fittybird x Kiabi. The existing project material examines an online shopping journey, a physical-store journey, and possible connections between them. The product direction is web-first, with an in-store pilot considered later; a proposed in-store flow uses a fitting-cabin screen and a staff tablet. This proposed product flow must not be confused with confirmation that Fittybird is already deployed in stores.

Project data reports fitting satisfaction of 13% online (3/10) and 75% in store (8/10), with item-return rates of 26.5% and 3.7% respectively. It does not show what share of returns is caused by fit or size, nor return-processing costs. Research and payment satisfaction differ by channel, so fitting should not be framed as the only journey issue.

Project documents also cover product/size availability, fitting-cabin and staff interactions, online product information, loyalty-card use, and Click & Collect. The source reports Click & Collect in 75 of 85 French stores and says the NFC tag counts entries; it does not confirm a unified customer-data link. Proposed Fittybird flows remain subject to validation and approval.

2.2 Facts, hypotheses, and proposed research

Documented information. Project figures and journey descriptions explicitly stated in the repository sources cited in Section 11. The 26.5% and 3.7% figures are item-return rates.

Unverified hypotheses. Possible explanations, including whether fit uncertainty causes returns, whether customers want cross-channel continuity, or whether staff workflows create repeated friction. These require evidence.

Proposed research activity. Interviews with customers and relevant operational stakeholders, subject to recruitment and access. The map is not evidence that access has been granted.

Proposed product / pilot flow. The in-store Fittybird screen-to-staff-tablet interaction and future cross-channel links are concepts in the project materials, not confirmed current KIABI services.

3. Stakeholder Identification

The map covers online, physical-store, and omnichannel customers plus five employee groups. These categories and their relevance are detailed in Sections 4 and 7; customer behaviours may overlap.

4. Stakeholder Profiles and Priorities

Online customers

- Role / relationship: Experience KIABI's digital discovery, product-information, size-selection, purchase, and post-purchase journey.
- Main research interest: Product discovery; online browsing; size and fit assessment; hesitation; checkout; delivery/collection; returns.
- Information they can provide: Recent examples of decisions, information used, uncertainty, channel choices, and post-purchase actions.
- Priority - Essential: Direct experience of the primary web-first problem area.

Physical-store customers

- Role / relationship: Experience store discovery, availability checks, fitting, assistance, and purchase.
- Main research interest: Product search; size availability; fitting-room experience; employee support; store payment; cross-channel alternatives.
- Information they can provide: Specific store visits, fitting and search experiences, interactions, and workarounds.
- Priority - Essential: Direct evidence is needed to understand the physical journey and compare channels.

Omnichannel customers

- Role / relationship: Move between online and store touchpoints; may use services such as Click & Collect where relevant.
- Main research interest: Journey transitions; continuity; channel switching; collection/return paths; expectations about shared information.
- Information they can provide: Actual sequences across channels, what carried over or did not, and reasons for switching.
- Priority - Essential: Needed to test cross-channel assumptions with real behaviour; may overlap with the two customer groups above.

Sales assistants / store associates

- Role / relationship: Support customers and store routines; may interact with fitting-cabin requests and staff devices.
- Main research interest: Customer requests; finding another size/colour; fitting-cabin support; workflow and proposed pilot fit.
- Information they can provide: Frontline observations, task sequence, information gaps, operational friction, and exceptions.
- Priority - Important: Provides essential-to-interpret store context, but does not replace customer evidence.

Store managers

- Role / relationship: Coordinate store-level operations and may assess local pilot readiness.
- Main research interest: Staff capacity; store routines; local constraints; device/network readiness; operational risks.
- Information they can provide: Local process context and practical requirements, if access and relevant responsibility are confirmed.
- Priority - Important: Explains feasibility and constraints, but is less direct evidence of customer experience.

Stock or inventory personnel

- Role / relationship: Handle or support product/size stock visibility and movement; exact role must be identified locally.
- Main research interest: Size availability; stock accuracy; replenishment; alternate-size searches; online/store availability handoffs.
- Information they can provide: How availability is checked and acted on, common constraints, and relevant process/data definitions.
- Priority - Important: Supports investigation of a documented journey topic; specific ownership/access is unknown.

E-commerce and digital stakeholders

- Role / relationship: Support or know the online service, product information, digital data, and technical capabilities.
- Main research interest: Product/size information; analytics; online journey; cross-channel capability; privacy and implementation constraints.
- Information they can provide: Current service and data context, known limitations, relevant definitions, and approval dependencies.
- Priority - Important: Provides supporting system context; their views should not be treated as customer evidence.

Customer service representatives

- Role / relationship: Respond to customer questions and post-purchase issues; exact service structure is not documented.
- Main research interest: Fit/size-related contacts; customer language; issue-resolution and return-support steps.
- Information they can provide: Examples of customer questions and support workflows, subject to access and privacy constraints.
- Priority - Interesting: Useful context for a later or targeted round; not a substitute for customers or validated return-reason data.

4.1 Priority rationale

- Essential: Online, physical-store, and omnichannel customers are the first priority because their own recent experiences directly answer the customer-behaviour and journey questions. These are behavioural lenses rather than mutually exclusive segments.
- Important: Sales assistants, store managers, stock/inventory personnel, and e-commerce/digital stakeholders can clarify how the service and operations work, what information exists, and what constraints matter. Their participation should follow or complement customer interviews, not lead the research in a way that biases it toward internal assumptions.

- Interesting: Customer service representatives may add valuable post-purchase context. They are placed in the later/optional tier for the initial round because access is unconfirmed and their observations cannot establish customer motivations or the proportion of returns caused by fit.

5. Stakeholder Relationship Map

The map below is a proposed research map of journey interactions, not a KIABI organisation chart. Solid arrows indicate customer-facing journey interactions or operational relationships described in project materials. Dotted arrows indicate relationships to investigate or proposed dependencies; they do not confirm reporting lines, current system integration, or granted access.

```
flowchart LR
    C[Customers<br/>online, store, cross-channel]
    O[Online platform / e-commerce journey]
    S[Physical store]
    A[Sales assistants / associates]
    M[Store managers]
    I[Stock / inventory roles<br/>exact ownership to identify]
    D[E-commerce / digital stakeholders<br/>exact structure to confirm]
    CS[Customer service representatives]
    K[KIABI data, product and size information<br/>access to confirm]

    C -->|browse, assess size, purchase| O
    C -->|search, check availability, fit, purchase| S
    C -.->|may move between channels; validate actual paths| O
    C -.->|may move between channels; validate actual paths| S
    S -->|frontline assistance| A
    M -.->|store-level coordination; relationship to validate| A
    M -.->|local operating context / pilot readiness| S
    I -.->|availability and size information / process to validate| S
    I -.->|availability information / handoff to validate| O
    D -.->|supports online service and information; scope to confirm| O
    D -.->|potential digital/store dependencies to validate| S
    CS -.->|responds to customer questions and problems| C
    CS -.->|may coordinate issue resolution; process to validate| S
    CS -.->|may coordinate issue resolution; process to validate| O
    K -.->|product/size data and definitions; access to confirm| O
    K -.->|product/size data and definitions; access to confirm| S
```

The proposed map is not an organisation chart. Reporting lines, shared customer records, inventory synchronisation, and cross-channel visibility are unconfirmed and should be investigated.

6. Interview Participant Prioritisation

6.1 First: essential customer experience

Begin with participants who have recent, specific experience of the relevant shopping journey:

1. Online customers, especially people able to recall a recent product/size decision and what happened after it. Include different outcomes where feasible; do not recruit only people who returned items.
2. Physical-store customers, including people who recently searched for a product or size and used, or chose not to use, a fitting room or staff assistance.
3. Omnichannel customers, identified by an actual sequence across channels (not by self-description alone). Many can also belong to the online or store groups, so classify each participant by observed/reported behaviour and record overlaps.

This first wave should focus on concrete past events and neutral exploration before presenting the Fittybird concept. Recruitment volume, quotas, and eligibility windows are intentionally left to Document 03 - Participant Recruitment Plan.

6.2 Next: operational perspectives

After initial customer interviews have clarified which moments and processes need explanation, consult sales assistants and, where useful and accessible, store managers. These conversations can test whether customer-described store interactions align with actual routines and identify local constraints. Include stock/inventory or e-commerce/digital stakeholders when customer evidence points to availability, product information, or digital capability as a relevant issue.

6.3 Later or if access and time permit

Consult customer service representatives for post-purchase and support context, particularly if customer interviews surface recurring help or return questions. Additional operational stakeholders can be added when a specific unanswered question or pilot dependency justifies it. No group should be interviewed merely to fill a list if access, relevance, consent, or research capacity is lacking.

7. Research Topics by Stakeholder

These are topic areas, not an interview script. Detailed, neutral questions belong in Document 04 - Interview Guides.

Online customers

- Shopping habits; product discovery and browsing; product information and size choice; fit confidence and uncertainty; purchase decision; delivery or collection; returns and post-purchase experience.

Physical-store customers

- Shopping habits; in-store product search; size and stock availability; fitting-room experience; assistance from employees; payment and post-purchase options; store-to-online or online-to-store transitions.

Omnichannel customers

- Actual sequence of online and store touchpoints; channel switching; Click & Collect or other cross-channel services actually used; continuity of product/size information; returns across channels; reasons for choosing each channel.

Sales assistants / store associates

- Customer assistance patterns; fitting-room and size/colour requests; finding alternate sizes; tools and information used; repeated work or delays; operational challenges and response to a proposed workflow (without assuming acceptance).

Store managers

- Local customer journey and store routines; staff/time constraints; fitting-area operations; local stock/service dependencies; readiness, approvals, and practical constraints for a potential pilot.

Stock or inventory personnel

- Product and size availability; stock visibility and accuracy; replenishment or alternate-size handling; relationship between store and online availability; operational exceptions and data limitations.

E-commerce and digital stakeholders

- Online browsing and size-information experience; available customer-journey measures and their definitions; digital service limitations; cross-channel capabilities; data/privacy and implementation dependencies.

Customer service representatives

- Customer questions about product, fit, or size; support and return pathways; recurring issues as observed by the service role; escalation and channel handoffs; limits of available support records.

8. Stakeholder Selection Criteria

Actual participants should be selected against the research objectives, not recruited solely because they match a persona label. Use the following criteria:

- Direct experience: the person has personally completed or supported the journey being discussed.
- Recent experience: the event or work practice is recent enough for the participant to describe concrete details. Document 03 should define a practical recency window before recruitment begins.
- Diversity of experiences and behaviours: seek variation in channel use, shopping purpose, size/stock outcomes, assistance use, and return/non-return experiences as access allows. Do not imply statistical representativeness from a small qualitative sample.
- Specificity: participants can recall a particular situation, sequence, decision, difficulty, or workaround rather than only general opinions.
- Relevance: the experience relates to fit confidence, product discovery, availability, channel transitions, fitting-room/service interactions, or post-purchase support.
- Role fit for employees: staff participants have relevant first-hand responsibility or observation; job titles alone are insufficient to establish relevance.
- Ethical and practical eligibility: participation is voluntary, informed consent is obtained, privacy is protected, and access/permission is confirmed before contact or recording.

Online, physical-store, and omnichannel behaviours may overlap. Classify customers using their actual reported behaviour and the journey being discussed, and allow multiple channel tags for one participant. Do not treat these as exclusive customer types. The existing personas help the team formulate areas to validate, but are not a recruitment quota or verified census of KIABI shoppers.

9. Stakeholder Mapping Limitations

The following access and evidence gaps remain open:

- Customer availability: no KIABI customers have been confirmed as interview participants, and no recruitment channel or permission is established by this map.
- Store access: access to sales assistants, store managers, fitting areas, or customer observation requires confirmation and may require KIABI approval.
- Stock/inventory access: the relevant role, process owner, information boundaries, and availability of inventory personnel are unknown.
- Digital/e-commerce access: the relevant contacts, available analytics, product/size data, and approval path are not confirmed.
- Customer-service access: team structure, support-record access, and privacy restrictions are unknown.
- Geography and store selection: no pilot store or geographic scope is confirmed here. The project source reports a French store footprint and Click & Collect availability, but does not grant access to any specific location.
- Cross-channel behaviour: the frequency and exact paths of customers' transitions, including Click & Collect use, remain to be established in research.

- Return causes: item-return figures are documented, but fit/size-specific causes and return-processing costs are not established by the available data.
- Method source availability: the repository did not include a standalone EPITECH exploratory interview presentation at drafting time. The assignment's priority definitions have been applied; check the original course material if exact terminology or a required technique differs.

10. Conclusion and Next Steps

Start with online, store, and omnichannel customers. Then add sales assistants, managers, inventory, and digital stakeholders for operational context; consult customer service if later evidence makes it relevant.

This is a research plan, not confirmation of access or reporting lines. Document 03 will define recruitment criteria, channels, participant mix, consent, and overlapping behaviours without assuming KIABI approval.
