Checkpoint 2a. Personas

Project: Fittybird x Kiabi, 360° Framework
Checkpoint: 2a, Period 2 (figure out who the user is)
Terms: `shared/glossary.docx`

Six personas, one per user type. Each is built from Kiabi data first, so a reader can follow every claim back to a figure. Attributes that are not in the data (age, job, city) are left out on purpose: they come from interviews in sprint 1 and are added to this file then.

1. Data trace: from Kiabi data to persona

Kiabi's deck describes seven market segments of the French ready-to-wear market (slide 2). The brief gives channel figures (pages 3 and 4). The table shows what each persona rests on.

Persona	Kiabi data behind it	Segment (share of buyers / share of turnover)	Source
Léa, online shopper unsure of size	Online fitting 13% satisfied, grade 3. Online return rate 26.5%, return grade 3.2	Les Connectés (13% / 12%): fashion comes through the internet, wants to stand out	Brief pp.3, 4. Deck slide 2
Karim, in-store shopper who dislikes shopping	In-store research 20% satisfied. Payment 19% satisfied, grade 5. Fidelity card 7.3 in store	Les Désimpliqués (25% / 20%): little interest in fashion, buy by need, basic offer	Brief pp.3, 4. Deck slide 2
Nadia, shopper who struggles to find a size	The deck says this segment has difficulty finding its size. Kiabi's list of collected data (slide 4) includes size and morphological information	Les Résignés (15% / 10%). Secondary: Les Intemporels (17% / 19%), who buy with reason and value quality	Deck slides 2 and 4
Lucas, budget-conscious trend follower	Largest turnover share of any segment. Online cart 67.53 €, returns 26.5%	Les Compulsifs (17% / 22%): love impulse buys, renew the wardrobe often, no unlimited budget. Trend 3 (Gen Y and Z)	Deck slides 2 and 11. Brief p.3
Inès, store associate	Cabin screen notifies a staff member with a tablet. Connected sellers' tablets are a store-to-web path. Clienteling tool scores customer satisfaction at checkout	Not a customer segment	Brief p.1. Deck slides 7 and 21
Claire, Kiabi e-commerce and marketing	Cross-channel customer 3 times more profitable (quote from Kiabi's e-commerce and marketing director). NFC tag only counts entries	Not a customer segment	Deck slide 6. Brief p.1

Coverage and what is left out

	Share of buyers	Share of turnover
Segments with their own persona (Désimpliqués, Résignés, Connectés, Compulsifs)	70%	64%
Intemporels, covered as a secondary link to Nadia	17%	19%
Not covered in version 1: Fashion Pressés	5%	4%
Not covered in version 1: Sans Limites	7%	12%

Fashion Pressés are few. Sans Limites are few but carry 12% of turnover and are worth a persona after the pilot. Both are left out for now to keep the pilot focused. This choice is logged as decision P1 in `C-backlog/decision-log.docx`.

The data comes from the deck's description of the French market. It is not a count of Kiabi's own customers. Interviews in sprint 1 check that these segments are present among Kiabi shoppers.

2. The six personas

Léa, the online shopper unsure of size

Segment	Les Connectés
Goals	Order the right size the first time. Find outfits that suit her

Frustrations	Sizes differ between brands, so she may order two sizes and send one back. Product photos show a model, not her. Evidence: online fitting 13%, returns 26.5%
How Fittybird helps	Her avatar wears the item and shows fit zone by zone, so she keeps one size in the cart
Channel	Mobile web and app
Success signal	Orders one size, keeps it
To validate in interviews	How often she orders two sizes. What decides a return

Karim, the in-store shopper who dislikes shopping

Segment	Les Désimpliqués
Goals	Get in, try a few items, leave quickly
Frustrations	Finding the item (research 20% satisfied) and the checkout (19%). A trip back to the shelves when a size is wrong
How Fittybird helps	Taps the loyalty card (or scans a QR code in the pilot), his avatar loads, and he asks for another size from the cabin screen with the fit already known
Channel	In-store mirror and cabin screen
Success signal	Fewer trips to the shelves
To validate in interviews	What makes research slow. Whether he would tap the card

Nadia, the shopper who struggles to find a size

Segment	Les Résignés, with a link to Les Intemporels
Goals	Know before she tries something whether the cut will suit her
Frustrations	Standard sizes do not fit her well, so shopping feels like a chore. The deck says this segment has difficulty finding its size
How Fittybird helps	A private avatar of her own shape with an honest fit view. She controls who sees it and can delete it
Channel	App first, then store
Success signal	Leaves with an item that fits
To validate in interviews	Her comfort with body photos. What she would need to feel in control

Lucas, the budget-conscious trend follower

Segment	Les Compulsifs
Goals	A good look at a low price. Renew his wardrobe often
Frustrations	Cannot afford a wrong size. Dislikes the effort of a return
How Fittybird helps	Quick try-on, saved looks, a link to ask friends before buying
Channel	Mobile app
Success signal	Fewer returns, more items kept
To validate in interviews	How much he cares about returns. Whether sharing looks matters

Inès, the store associate

Context	Works the shop floor with a tablet, is notified when a customer asks for a size or color from the cabin
Goals	Serve customers fast and avoid a wrong fetch
Frustrations	A vague request means two trips to the stockroom
How Fittybird helps	The request carries the customer's fit view, so she brings the right size once
Channel	Staff tablet
Success signal	Fewer wrong-size trips

To validate in interviews	How requests arrive today. How many fetches are repeats

Claire, the Kiabi e-commerce and marketing manager

Goals	Raise conversion, cut returns, link online and shop data on one customer
Frustrations	Channels hold separate data. The NFC card is barely used
How Fittybird helps	A dashboard of try-on usage, size choices and cross-channel sessions
Channel	Back-office dashboard
Success signal	A readable return-rate effect on the pilot articles
To validate in interviews	Which three numbers she looks at first

3. How the development team uses the personas

Personas exist to keep the user's point of view in every technical decision. The team uses them in six concrete ways.

When	What the team does	Who
Writing a story	Every user story starts "As " and names one primary persona. A story with no persona is not Ready	Product manager
Refining the backlog	For each story, the team asks "which persona benefits, and which data supports it?" before it is sized	Whole team
Defining acceptance criteria	Criteria are written from the persona's view ("Léa sees her size advice without leaving the try-on")	Story author, reviewed by the UX lead
Making a trade-off	When two options compete, the team picks the one that serves the persona with the stronger data behind it. The answer goes in the decision log	Whole team
Sprint review	The demo follows one persona's journey from start to finish. A team member plays the persona	UX lead
Keeping them alive	After sprint 1 interviews and after the pilot, the personas are updated and the changes are noted in the decision log	UX lead

The persona cards live in this repository, so developers can open them from a story. Each card shows the segment, the data behind it, the goal and the frustration.

4. Changes from the first version

The first version of this file gave each persona an age, a job and a city. Those details were not in the Kiabi data, so they were removed. The data trace above replaces them.
