Checkpoint 1a. Product manifesto

Project: Fittybird x Kiabi, 360° Framework
Checkpoint: 1a, Period 1 (align the vision)
Annexes: `00-bootstrap/` (data analysis, journey maps, growth levers and web-first rollout). Terms are defined in `shared/glossary.docx`.

1. In one paragraph

Fittybird x Kiabi shows shoppers how a garment looks and fits on their own body before they buy, online first and then in store. A cartoon bird holds a magic mirror, and the mirror shows a live avatar built from a few photos, wearing the chosen item. It answers the weakest stage of Kiabi's online journey: fitting is rated 3 out of 10 online against 8 in store, and 26.5% of items sold online come back against 3.7% in store (`00-bootstrap/01-data-analysis.docx`).

2. What the product is and is not

It is	It is not
A try-on mirror: the avatar wears real Kiabi items and shows fit zone by zone (tight, right, loose)	A body scanner. No booth, no special hardware: phone photos are enough
One avatar reused online and in store, tied to the customer's Kiabi account or loyalty card	One app per channel with separate data
An aid to choose a size with confidence	A guarantee of fit, or a replacement for the fitting cabin
For adults. No avatar try-on for children	For children
Web first, with one in-store pilot second	A full rollout across 85 stores
A product that could outgrow Kiabi and serve other retailers later	A beauty filter or a social app
A hand-off to Kiabi's own cart and checkout	A new payment system

3. Who it is for

Six user types. Each one is traced to Kiabi data in `2a-personas/personas.docx`.

User type	Persona	Characteristics	Data behind it
Online shopper unsure of size	Léa	Orders on mobile, hesitates on fit, may order two sizes and return one	Online fitting 13%, return rate 26.5%. Market segment "Les Connectés" (13% of buyers, 12% of turnover)
In-store shopper who dislikes shopping	Karim	Wants a short visit, holds the loyalty card	Store research 20% satisfied. Segment "Les Désimpliqués" (25% of buyers, 20% of turnover)
Shopper who struggles to find a size	Nadia	Shops in both channels, often leaves empty-handed	Segment "Les Résignés" (15% of buyers, 10% of turnover), described in the deck as having difficulty finding their size
Budget-conscious trend follower	Lucas	Renews the wardrobe often, cannot afford wrong sizes	Segment "Les Compulsifs" (17% of buyers, 22% of turnover, the largest turnover share)
Store associate	Inès	Carries a tablet and fetches sizes from cabin requests	Cabin screen and tablets (brief p.1, deck slides 7 and 21)
Kiabi e-commerce and marketing team	Claire	Owns conversion, returns and the customer relationship	3 times more profitable cross-channel customer (deck, slide 6). NFC tag that only counts entries

4. Needs and problems

User need	Problem today	Evidence
Know how it fits before buying	Cannot judge fit on a screen	Online fitting 13% satisfied, grade 3 (brief pp.3, 4)
Not to send items back	26.5% of online items are returned	Brief p.3
A short, easy shop visit	Finding an item is hard in store	In-store research 20% satisfied (brief p.3). Cause to validate in interviews
Not to fetch a second size	A trip back to the shelves	Brief p.1, cabin screen was built to remove this irritant

Not to retain a second size	A trip back to the shelves	Brief p.1; cabin screen was built to remove this irritant
One relationship across channels	Channels do not share data	NFC tag only counts entries (brief p.1)
Privacy and control over photos	Body photos are sensitive	No Kiabi figure. Raised as risk R1 and R9

5. Challenges for Kiabi

Challenge	Evidence
Online returns cost far more than store returns	26.5% against 3.7%. Value sent back per average cart about 17.90 € online against 1.08 € in store (finding F4)
Cross-channel customers are worth 3 times more but the link between channels is thin	Deck slide 6, brief p.1
Differentiation through customer experience	Trend 8 (deck). The cabin renewal is already a differentiator
Unused investment in the NFC loyalty card	Brief p.1
Trust in a body-photo feature	Risks R1 and R9

The cost of one return and the share of returns caused by fit are not in Kiabi's data. They are requested (`00-bootstrap/01-data-analysis.docx`, section 3).

6. Value proposition

The customer	Fittybird x Kiabi
Jobs: find clothes that suit me, pick the right size, shop fast	**Products:** one avatar from photos, try-on on real catalog items
Pains: unsure how it fits, sizes differ by brand, waiting for staff, returning items	**Pain relievers:** fit shown zone by zone, size advice, one-tap size request from the cabin screen
Gains: confidence at checkout, no trip back to the shelves, a look I like	**Gain creators:** same avatar online and in store through the loyalty card, saved looks

7. Quantified success criteria

Targets are hypotheses to test in the pilot. Baselines come from Kiabi. Where there is no baseline, we measure one in the first pilot weeks.

Metric	Baseline (source)	Target at pilot	Measured by
Online item return rate on pilot articles	26.5% (brief p.3)	23.5%, a 3-point fall, against a control group	Kiabi returns data, US-15, US-22
Online fitting grade among users who tried on	3 out of 10 (brief p.4)	5 out of 10 or more	One-question in-app survey
Avatar completion	None	70% of started captures finish	Funnel events (US-22)
Time to first avatar	None	Under 3 minutes, median	App timing events
Sessions with a try-on	None	40%	Session analytics
Size trust ("I trust this size")	None	4 out of 5 after a try-on	In-app survey
In-store reuse of the web avatar	Loyalty card grade in store 7.3 (brief p.4)	20% of pilot-shop card or QR visits open a mirror session	Tap and scan events

Web and store criteria are separate on purpose: in store, fitting is already 75% satisfied, so the pilot is judged on speed and identity, not on fit (`00-bootstrap/02-journey-maps.docx`).

8. How this manifesto links to Kiabi's growth levers

Fittybird pulls four levers: cross-channel customers (L1), customer experience (L2), digital try-on (L3) and fewer returns (L4). Each one is tied to a macro trend in the Kiabi deck and a KPI in `00-bootstrap/03-growth-levers-and-web-first.docx`.

9. Decisions made in this checkpoint

See `C-backlog/decision-log.docx`: B1 to B4 and D1 to D3.
