Bootstrap 1. Data analysis of the Kiabi figures

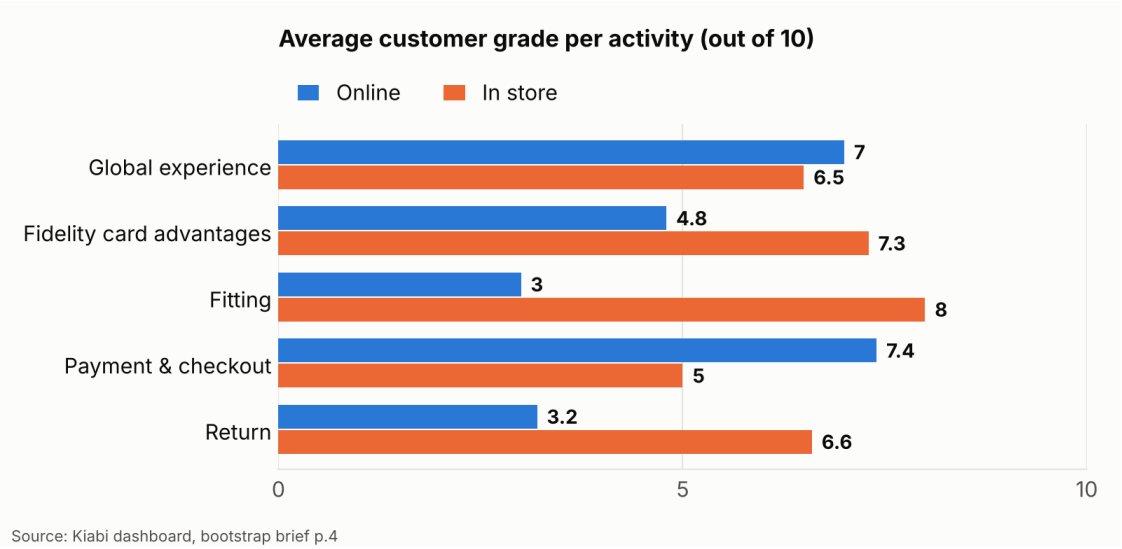

Project: Fittybird x Kiabi, 360° Framework
Handed in with: checkpoint 1a (annex)
Sources: Kiabi dashboard in the bootstrap brief (`360framework-bootstrap.pdf`, printed pages 2 to 4) and the Kiabi data deck (`bootstrap-kiabi.pptx`, slides 2 to 7). Page and slide numbers are given next to each figure so the team can check them.

1. The figures we use

Online against in store

Metric	Online	In store	Source
Items return rate	26.5%	3.7%	Brief p.3
Average shopping cart	67.53 €	29.08 €	Brief p.3
Monthly traffic	8,792 unique visitors on the e-store	1,238 visits (average store)	Brief p.3, see note 1
Customer grade for fitting (out of 10)	3	8	Brief p.4
Customer grade for return (out of 10)	3.2	6.6	Brief p.4
Customer grade for payment and checkout (out of 10)	7.4	5	Brief p.4
Customer grade for fidelity card advantages (out of 10)	4.8	7.3	Brief p.4
Customer grade for global experience (out of 10)	7	6.5	Brief p.4

Source: Kiabi dashboard, bootstrap brief p.4

Network and customer base

Metric	Value	Source
Stores in France	85, of which 75 offer Click & Collect	Brief p.3
Checkout per customer per year	500 €	Brief p.3
Checkouts per customer per year	13	Brief p.3
Articles per customer per year	26	Brief p.3
Customers over 15 years old	91.5%	Brief p.3
Share of ready-to-wear turnover	Women 53%, men 32%, children 15%	Brief p.3
Cross-channel profitability	A cross-channel customer is 3 times more profitable than a single-channel one (Cyril Olivier, e-commerce and marketing director, Kiabi, quoted in LSA)	Deck slide 6

Note 1. The dashboard labels the store figure "monthly average visits in stores", and its chart is titled "average stores visits". We read 1,238 as the monthly visits of an average store, not of the whole network. Visitors (online) and visits (stores) are not the same unit, so we do not compare them directly. To confirm with Kiabi.

Note 2. The dashboard shows "average checkout per customer 19.20 €". Dividing 500 € by 26 articles gives 19.23 €, while dividing by 13 checkouts gives 38.46 €. The label most likely describes the average price per article. To confirm with Kiabi.

2. What the data says

#	Finding	Calculation	Why it matters
F1	Online returns are about 7 times store returns	26.5 / 3.7 = 7.2	Returns are the clearest cost gap between the channels
F2	Online fitting is the weakest stage of the online journey: 13% satisfaction and a grade of 3 out of 10, against 75% and 8 out of 10 in store	75 − 13 = 62 points	A customer cannot judge fit on a screen. This is the problem Fittybird solves
F3	An online cart is 2.3 times larger than a store cart	67.53 / 29.08 = 2.3	Each online return costs a bigger basket

#	Finding	Calculation	Why it matters
F4	Value sent back per average cart: about 17.90 € online against 1.08 € in store	67.53 × 26.5% and 29.08 × 3.7%, assuming returns are proportional to value	The exposure per online cart is about 17 times higher
F5	The fidelity card is rated 7.3 in store and 4.8 online. The brief adds that the NFC tag only counts shop entries	Brief p.1 and p.4	The card is a ready identity link between channels that nothing uses yet
F6	In store, research (20% satisfied) and payment (19%) are the weak stages	Brief p.3	Fitting in store is already strong, so the store value of Fittybird is elsewhere (see journey maps)
F7	Online turnover is roughly one fifth of the total	Charts p.2: about 420 K€ per month online at the end of the year, about 19 K€ per month for an average store, times 85 stores, about 1,615 K€	Approximate, read from the charts. It shapes the web-first trade-off
F8	The lockdown year moved traffic online	Charts p.2: store visits fall to about 300 in March then settle near 1,300. E-shop visitors rise from about 2,000 in April and May to about 10,000 in June and a peak near 14,500 in November	Online traffic stays high after the lockdown, so the online pain is lasting

Findings F7 and F8 are read from line charts without data labels, so treat them as orders of magnitude.

3. What the data does not say

These gaps matter because the solution is justified by returns. We do not invent them. We request them. Version 2 adds three requests that the target architecture (3a) and risk review (3b) depend on: garment images (R15), a loyalty-card number check (D18) and a privacy contact (R9).

Missing figure	Needed for	Data request to Kiabi	Owner (proposed)	Due
Cost to process one returned item (reverse logistics, handling, lost resale value)	Value of one avoided return	Average cost per online return and per store return	Hadeed	Sprint 1, week 1
Share of returns caused by size or fit	How much of the 26.5% Fittybird can reach	Return reason codes, split by size, fit, quality, other	Hadeed	Sprint 1, week 1
Online orders per month and conversion rate	Size of the pilot, baseline for the funnel	Orders and visitor-to-order rate per month	Hadeed	Sprint 1, week 1
Size charts for the pilot articles	The fit engine (US-09, US-10)	Size chart per pilot article	Muhammad	Sprint 1, week 2
Meaning of the 19.20 € and 1,238 figures	Reading the dashboard correctly	Written confirmation of both definitions	Elie	Sprint 1, week 1
Garment images usable for try-on	The try-on renderer (SP-02, D16)	Front and back catalog images for the 20 pilot articles, on a plain background, with the right to use them in the app	Hadeed	Sprint 1, week 1. Needed by week 2 (R15)
Whether a loyalty-card number can be checked	The card link (US-23, D18)	Whether Kiabi can check a card number through the adapter, and who at Kiabi owns the answer	Hadeed	Sprint 1, week 1
Kiabi privacy contact and rules for photos and body data	The privacy checklist (PRIV-01) and the full review (PRIV-02)	Name of a privacy contact, and Kiabi rules on photos, body data and retention	Hadeed	Sprint 1, week 1

4. How the figures justify the solution

Fittybird targets the weakest online stage (fitting, 13%) and its main cost (returns, 26.5%).

The value of the solution is one formula:

```
Saving per month = online items sold x reduction in return rate x cost of one return
```

Two of the three terms are open (items sold, cost of one return). The third is our hypothesis, anchored on the baseline:

- **Pilot hypothesis:** the return rate on pilot articles falls from 26.5% to 23.5% (3 points) for shoppers who tried the article on. That is 11% fewer returned items (3 / 26.5) and 30 fewer returns per 1,000 items sold online.
- **How we test it:** a control group of shoppers without try-on, same articles, same weeks (backlog item US-22 and the measurement rules in the roadmap).
- **What would change our mind:** if the data request shows that size and fit cause only a small share of returns, the target moves from the return rate to the fitting satisfaction score (13% baseline), and the business case is re-written before sprint 3.

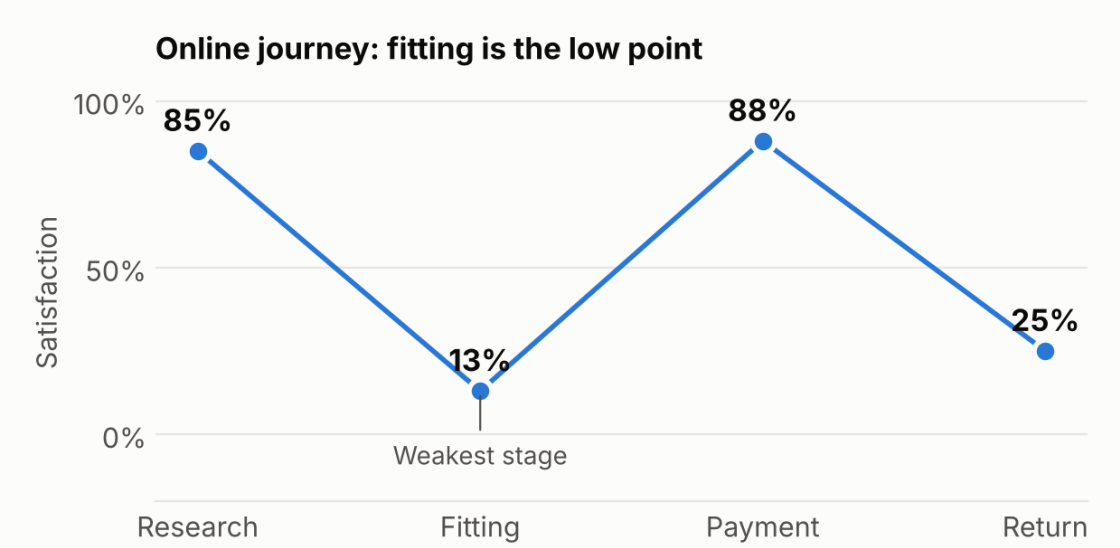

The 3-point target is a hypothesis to test, not a Kiabi figure.

Bootstrap 2. Customer journey maps: online and in store

Project: Fittybird x Kiabi, 360° Framework
Handed in with: checkpoint 1a (annex)
Sources: satisfaction per stage and grades per activity from the Kiabi dashboard (bootstrap brief, printed pages 3 and 4). Cross-channel paths from the Kiabi deck, slide 7. Pains that the data does not show are marked **to validate**: they come from our reading and must be tested in interviews (sprint 1).

The two journeys are kept apart on purpose. The dashboard measures them separately, they peak at opposite stages, and the solution does not play the same role in each.

1. Online journey

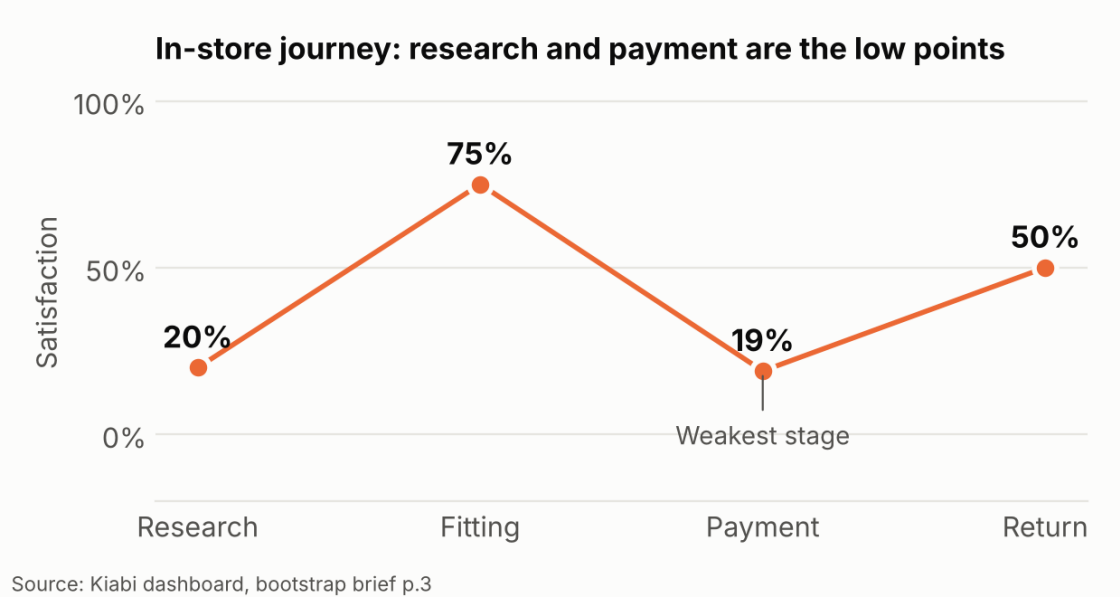

Source: Kiabi dashboard, bootstrap brief p.3

Stage	Satisfaction	Grade (out of 10)	What the customer does	Pain	Fittybird touchpoint	KPI
Research	85%	not graded	Browses the e-store or app, filters, uses the wishlist	Little: this is the best-rated online stage. Source of the pain downstream: the product page cannot show fit	Catalog with a try-on entry on each article (US-07)	Share of sessions that open a try-on
Fitting	**13%**	**3**	Guesses a size from a chart, sometimes orders two sizes	Cannot judge how the item fits or looks on their own body. Weakest stage of the whole online journey (evidence)	Avatar, try-on and fit view per body zone (US-04 to US-10)	Fitting grade and satisfaction among users who tried on, against the 3 out of 10 baseline
Payment	88%	7.4	Checks out on Kiabi	Little. Strongest online stage	None. The cart hands off to Kiabi checkout and Fittybird does not touch payment (US-12)	Hand-off rate from fit view to cart

Stage	Satisfaction	Grade (out of 10)	What the customer does	Pain	Fittybird touchpoint	KPI
Return	25%	3.2	Sends items back, mostly for a wrong size (to validate: the size share of returns is not in the data)	26.5% of items come back, and the return experience is rated 3.2 (evidence)	Return reason captured after purchase (US-15), size advice that cuts avoidable returns	Online return rate on pilot articles, against the 26.5% baseline

Reading the map: the online customer is happy to search and to pay, and unhappy in the middle (fitting) and at the end (return). The two weak stages are linked: a poor fitting step creates the returns. Fittybird acts on the first to reduce the second.

2. In-store journey

Source: Kiabi dashboard, bootstrap brief p.3

Stage	Satisfaction	Grade (out of 10)	What the customer does	Pain	Fittybird touchpoint	KPI
Research	20%	not graded	Looks for an item or a size on the shelves, may use an in-store terminal that shows the whole collection (about 6,000 items per season, deck slide 19)	Low satisfaction (evidence). Cause not in the data: to validate (finding the item, finding the size, no link to online wishlist)	Mirror loads the avatar after the phone scans its pairing QR code (US-13) and shows the catalog	Share of pairing scans that open a mirror session
Fitting	**75%**	**8**	Tries items in the renovated cabin. The cabin screen lets the customer ask a staff member for another size or color	Little. This is the strongest in-store stage and Kiabi's differentiator (brief p.1)	Fit view in the cabin and a size request that carries the fit context (US-14, US-17)	Wrong-size fetches avoided (to measure in the pilot)
Payment	19%	5	Pays at the checkout. Kiabi is deploying self-checkout and looking at mobile payment from the customer's own device (deck slide 20)	Low satisfaction (evidence). Cause not in the data	**Out of scope.** Kiabi's self-checkout work already targets it	None
Return	50%	6.6	Brings items back to the shop. Only 3.7% of items are returned in store	Fair. Few returns	Return reason capture after purchase (US-15)	In-store return rate

Reading the map: the in-store customer is happy to try things on and unhappy before (finding the item) and at the end (paying). Fitting is already good, so the value of Fittybird in store is not "better fitting". It is a faster start (research, identity) and fewer trips to fetch another size.

3. Cross-channel moments

The deck (slide 7) lists the paths where a customer crosses channels. These are the moments where one shared avatar tied to the loyalty card is useful.

Direction	Kiabi path (deck, slide 7)	Fittybird role
Web to store	Click and collect, e-reservation, returns in store, product locator, store locator	The avatar and chosen size follow the customer into the shop (pairing QR code in the first pilot, one-time card link D18)
Store to web	Connected terminals, tablets for sellers, showrooming	Items tried in the cabin appear in the customer's saved looks for later online purchase
Social	Live shopping	Not in scope for version 1

Kiabi's director of e-commerce and marketing says a cross-channel customer is 3 times more profitable than a single-channel one (deck, slide 6). Nothing in the data tells us how many customers are cross-channel today. That figure is in the data request (see 01-data-analysis.docx, section 3).

4. What the two maps tell the roadmap

Observation	Decision it supports
Online fitting is the lowest score in either journey (13%, grade 3)	Build web first (see 03-growth-levers-and-web-first.docx)
In-store fitting is already 75%	The store pilot proves identity and speed, not fit. Its success criteria are different from the web ones
In-store payment and online returns are weak but outside the product's reach or secondary	We do not promise to fix payment. We measure returns

Bootstrap 3. Kiabi's growth levers and the web-first rollout

Project: Fittybird x Kiabi, 360° Framework
Handed in with: checkpoint 1a (annex)
Sources: Kiabi macro orientations (deck, slides 9 to 17), cross-channel quote (slide 6), phygital feedback (slides 18 to 21), dashboard figures (brief pp.2 to 4).

1. Kiabi's macro orientations and where Fittybird connects

The deck presents numbered macro trends to follow. Nine of them are in the file we received: 1, 2, 3, 4, 5, 6, 8, 9 and 15. We use only what is in the file.

#	Trend (deck)	Figure in the deck	Link to Fittybird	Strength
1	Aging developed countries	Seniors are about 30% of the population by 2030. The "silver economy" reaches 32% of EU wealth creation by 2025	Older shoppers who want comfortable, correctly sized clothes. Our screens use large touch targets (44 px or more)	Indirect
2	"Younging" emerging economies	90% of the world's under-30s live in emerging markets	Not relevant to a France pilot	None
3	Generations Z and Y at scale	Gen Y is 75% of the workforce by 2030. Values: thoughtful consumption, healthy living	Mobile-first design. Personas Léa and Lucas	Direct
4	Redefinition of the family	In France, single-parent households grow by 75% to reach 46% of households by 2030	Time-poor parents who buy for themselves and their children. Limit: no avatar for children in version 1	Indirect, with a stated limit
5	Striking inequalities	The richest 1% hold close to two thirds of world wealth by 2030	Price-sensitive shoppers cannot afford a wrong size. Lucas	Indirect
6	Ultra-urban world	70% of the world's population in cities by 2050	Dense city shops are where the mirror can be piloted	Indirect
8	Customer experience as the new battleground	R&D spending of Google, Amazon, Facebook and Apple up 131% since 2014	Fittybird is a customer-experience feature. It answers the online fitting gap (13%)	Direct
9	Purpose-driven businesses	Two thirds of consumers prefer companies with a purpose	Fewer wrong-size parcels is a candidate story. We make no environmental claim until we measure returns avoided	Indirect
15	New distribution models with digital technology	Example in the deck: augmented-reality make-up try-on at home, order online	Closest precedent for a virtual try-on. Fittybird applies the idea to clothes	Direct

2. The growth levers we pull

Lever	Evidence	What Fittybird does	KPI
L1 Cross-channel customers	A cross-channel customer is 3 times more profitable (deck, slide 6). The NFC tag only counts entries (brief p.1)	One avatar tied to the loyalty card, used online and in store	Share of sessions that start in one channel and continue in the other (to measure)
L2 Customer experience	Online fitting 13% satisfied, grade 3 (brief pp.3 and 4). Trend 8	Try-on and fit view per body zone	Fitting grade and satisfaction among users who tried on
L3 Digital try-on	Trend 15, the AR precedent	Avatar built from photos, no scan, no hardware	Avatar completion rate, time to first avatar
L4 Fewer returns	26.5% of items returned online against 3.7% in store	Size advice and fit view before purchase	Return rate on pilot articles against a control group

3. Rollout options considered

Criterion	Web first	Store first	Both at once
Size of the problem	Largest: fitting 13%, returns 26.5%	Smaller: fitting 75% already	Covers both
Revenue base	About one fifth of turnover (finding F7, approximate)	About four fifths	Both
Dependencies	Catalog and size charts only	Mirror hardware, staff training, NFC integration, shop approval	All of the above
Time to first real feedback	Fast: no shop needed	Slow	Slow
Fits a 4-person team over 12 weeks	Yes	Hard	No
Cross-channel promise	Delayed to the pilot	Delayed	Immediate but thin

4. Decision: web first, one store pilot second

Web first, because it targets the biggest measured problem, needs the fewest dependencies and gives feedback fastest. One store pilot follows in sprints 4 to 6 to prove the cross-channel link. The avatar built on the web is reused in the store, so the early work is not lost.

The sprints are shown in `A-roadmap/roadmap.docx`. The reasoning is recorded in `C-backlog/decision-log.docx`, decision B3.

5. Operational trade-offs of the web-first rollout

Trade-off	What we give up	What we gain	Mitigation	Owner (proposed)
Start on the smaller revenue base	The channel with about four fifths of turnover waits	Learning on the channel with the biggest pain, fast	The store pilot is planned in sprints 4 to 6, not "later"	Elie
In-store fitting is already strong	A weaker "wow" in shops for now	The store pilot is judged on speed and identity, not fit	Separate success criteria for web and store in the manifesto	Elie
NFC card unused until the store pilot	The loyalty-card story waits	A shorter critical path	A QR code stands in for the card tap in the first pilot (decision D6)	Muhammad
Customer questions land on Kiabi's customer service	An extra topic (avatar, photos, privacy) for their team	A real channel to learn from	Short FAQ and a named Kiabi contact before launch	Hadeed
Catalog readiness	Only pilot articles are covered	Size charts prepared for a small set	Size charts requested in sprint 1 (data request)	Hadeed
Measuring the effect	A control group means some shoppers get no try-on	A real answer on returns	Control group and return-reason tagging from the first pilot week (US-15, US-22)	Hadeed
Store staff hear about it late	Associates are briefed in sprint 4 only	No hardware or training cost before the idea is proven	Pilot shop and briefing planned as OPS-02	Hadeed
Privacy exposure from day one	A launch gate before real users	Trust, and no rework later	Privacy review before any real user photo (risk R9)	Muhammad
Team capacity	Four people, about 12 weeks	Focus on one channel at a time	Sprint 5 holds the Should items that can move	Elie

6. When we would change course

These thresholds are proposals for the team to confirm at the first risk review.

Signal	Threshold (proposal)	Response
Avatar completion on web tests	Below 50% at the sprint 2 demo	Re-plan sprint 3 around capture quality before try-on
Size and fit share of returns (from Kiabi)	Small share of the 26.5%	Move the success target to the fitting score and rewrite the business case
Kiabi cannot supply size charts	None for 20 pilot articles by the end of sprint 1	Build with hand-prepared charts for 20 articles
No shop agrees to a pilot	None confirmed by the end of sprint 3	Run the mirror demo with staff-only testers
